1.0 INTRODUCTION

The PRC Environmental Management, Inc. (PRC) TES 9 Team received Work Assignment No. C05101 from the U.S. Environmental Protection Agency (EPA), under Contract No. 68-W9-0006 (TES 9) to provide enforcement/litigation support to EPA for the USS Lead Refining, Inc. (USS Lead) site. TechLaw, Inc., TES 9 team member, provided the necessary assistance to complete this work assignment by developing a waste transaction database (TDB) and volumetric ranking summary.

All project activities and data extraction procedures used to develop the TDB and volumetric ranking are documented in Section 2.0 of this final waste transaction summary report. Appendix A contains the database field definitions and extraction procedures; Appendix B contains the list of potentially responsible parties (PRPs) and corresponding address information; Appendix C contains the volumetric ranking summary, and Appendix D contains the waste transaction database summary.

1.2 Site Background

The USS Lead Refining, Inc. (USS Lead) site is located at 5300 Kennedy Avenue in East Chicago, Indiana. USS Lead was a primary lead smelter from approximately 1906 until 1973 when it became a secondary lead smelter. It continued as a secondary lead smelter until 1985.

USS Lead accepted batteries and scrap lead for recycling and secondary smelting. The batteries were accepted from small entrepreneurial dealers and from larger companies on conversion contracts.

USS Lead generated calcium sulfate sludge, rubber battery chips, waste water, and bag house dust, all of which are hazardous. All of the hazardous waste was stored or disposed of on-site. This has caused lead as well as other forms of contamination of the soil, water and air.

In 1983-1984, USS Lead was in the process of eliminating its onsite waste storage and disposal activities. EPA requested that USS Lead submit a closure plan under the Resource Conservation and Recovery Act (RCRA). USS Lead was planning to recycle the bag house dust which contained 20-60 percent lead. Its closure plan was found to be inadequate and in 1985 EPA issued a RCRA corrective action against USS Lead.

In 1984 Ecology and Environment was contracted by EPA to perform a preliminary assessment and site inspection for the purpose of scoring the site for inclusion on the National Priorities List. The site was recommended by the State of Indiana for

Superfund action due to the unwillingness and financial inability of USS Lead to undertake proper environmental measures at the site.

1.2 History of Operations

As stated in the USS Lead Refining, Inc. PRP Search Report prepared by EPA in 1987, batteries were brought into the facility by trucks and weighed. The trucks were unloaded and the complete batteries were separated. The complete batteries were put on a conveyer belt and the tops were cut off and the terminals were removed. The battery cases were then turned upside down and the acid was drained into a large tank and neutralized. The lead plates were pulled from the cases and the cases were crushed. The lead plates and terminals were placed into a blast furnace for smelting and the steel cases were placed into the blast furnace to act as flux. The plastic cases were shipped to a plastic recycler to be made into plastic pot holders and the rubber cases were stored on-site in a waste pile. neutralized acid was discharged to the sewer and the waste water generated in the process was discharged into the Grand Calumet River.

USS Lead disposed of its hazardous waste on-site throughout its operational history. The largest quantity of waste was the bag house dust which had high concentrations of lead and other heavy metals. Storage piles were located behind the bag house. Slag was disposed in a marshy area of the Grand Calumet River which is a short distance away from the bag house. Slag was also placed in a landfill which was located south of the raw material storage area. Calcium sulfate sludge was also stored in piles south of the bag house. None of the storage piles were maintained properly; USS Lead had no cover and no control for run-on or run-off.

USS Lead submitted a RCRA Part A application on November 17, 1980. On August 12, 1981, EPA issued a Complaint and Findings of Violation for not protecting the waste piles from dispersal by wind. On February 24, 1982, USS Lead entered into a Consent Decree stating that compliance had been met by spraying the waste piles with a binder called "Coherex." USS Lead also paid a \$1,000 civil penalty.

On February 10, 1982, EPA requested a RCRA Part B application from USS Lead. Instead of a RCRA Part B application, USS Lead submitted a closure plan for their waste units on August 12, 1982. The Division of Land Pollution of the Indiana State Board of Health (DLP-ISBH) issued a Notice of Deficiency on the closure plan on August 24, 1984. On March 29, 1985 EPA again requested USS Lead to submit a Part B application; USS Lead did not respond and consequently lost their Interim Status on November 8, 1985. The DLP-ISBH requested financial assurance

from USS Lead on March 29, 1985, however, USS Lead never provided this information. Subsequently, USS Lead was issued a Notice of Violation by EPA.

On September 11, 1985, EPA issued USS Lead a Corrective Action Requirement request. This request required certification that either no releases had occurred from the facility or that corrective action had been taken for any release that did occur. USS Lead did not respond.

In summary and as stated in the USS Lead Refining, Inc. PRP Search Report, USS Lead has never taken the appropriate actions necessary to prevent any releases of hazardous substances into the environment. In fact, all efforts by EPA and DLP-ISBH to bring USS Lead into regulatory compliance have been ignored by USS Lead.

2.0 PROJECT ACTIVITIES

TechLaw was requested by EPA work assignment manager (WAM) to focus on the work plan activities applicable to the development of the TDB and volumetric ranking summary. The other activities outlined in the approved work plan will be addressed by TechLaw at a later date and at the request of EPA WAM.

Activities 1 and 7 of the approved Work Plan are applicable to the development of the TDB and volumetric ranking summary and are outlined below.

Activity 1 - Maintain Communications with EPA

TechLaw contacted EPA WAM, Ms. Evette Bryant, to obtain specific direction concerning the development of the TDB and volumetric ranking summary. TechLaw also consulted with EPA WAM to establish the information requirements of the project, the work schedule, and the types of work products needed.

Activity 7 - Develop a Waste Transaction Database

Five boxes of documents obtained from the USS Lead Refining, Inc. site were provided by EPA to TechLaw. The files were organized by PRP, arranged alphabetically by PRP name, and the documents were sequentially numbered by another EPA contractor. Therefore, additional review and organization by TechLaw was unnecessary.

TechLaw produced a computerized program utilizing Foxpro management software on an IBM-compatible personal computer (PC) for the development of the TDB and volumetric ranking. The fields in the database were designed to reflect project information requirements as specified by EPA WAM.

The following fields were used in the USS Lead site waste transaction database:

IELD	NAME	<u>DESCRIP</u>	TIC	<u> 1C</u>

TRANSNO Computerized record number which is automatically assigned to each entry in the TDB

GENERATOR Generator of the waste Transporter of the waste TRANSPORT Date of the transaction DATE Contract number CONTRACT LOT Lot number Volume (weight) of waste WEIGHT Unit of volume UNIT Cost of the transaction COST

Type of waste WASTE

Document number DOCNO DOCTYPE Type of document Comments COMMEN1 & COMMEN2

A data extraction sheet was designed in conjunction with EPA WAM based on project information requirements (see Figure 1 on page 7). Information from the site documents was recorded on the extraction sheets. Separate database files for coding repetitive categories of information such as, type of waste and type of document were developed. These "match files" which consist of a code number and specific waste type/document type were created to allow data extraction and data entry activities to be performed consistently and accurately.

Information from the extraction sheets was entered into the waste transaction database.

As directed by EPA WAM, TechLaw performed a 20% quality assurance/quality control (QA/QC) review to ensure the accuracy, completeness, and consistency of the database. A firstgeneration printout of the database was produced and compared to the original project documents. Any changes and corrections were recorded directly on the printout and entered on the database.

3.0 PROJECT ASSUMPTIONS

The following is a list of assumptions that were followed while compiling the TDB.

Data from contract documents were extracted only if the 1. contracts included transactional information for a specific waste shipment or could be used as a supporting document. An exception to this would be if the contract was the only document in a PRP file.

In this case, the data from the contract was extracted and a note "Contract was only supporting document" was recorded in the COMMEN1 field.

 Data from contract letters were extracted only if the contract letters included transactional information for a specific waste shipment or could be used as a supporting document.

An exception to this would be if the contract letter was the only document in a PRP file. In this case, the data from the contract letter was extracted and a note "Contract was only supporting document" was recorded in the COMMEN1 field.

- 3. For instances when a contract number and a lot number were not provided (i.e., transactions involving lead shipments), the shipment number and order number of the transaction were noted in the COMMEN1 field.
- 4. Many documents contained handwritten notes stating "their weight" and "our weight" which described a particular waste transaction. When discrepancies were found between the two, "their weight" was recorded in the WEIGHT field, and TechLaw assumed "their" referred to the generator or transporter.
- 5. When gross weight, tare weight, and net weight were provided on the supporting documentation (i.e., accounts payable vouchers), only the net weight was noted in the WEIGHT field as the volume of waste.
- 6. The accounts payable ledger documents contain information in terms of "wet weight" for each transaction; therefore, the wet weight was noted in the WEIGHT field as the volume of waste.
- 7. When the pre-paid amount, the balance due amount, and the total amount due were provided on the Accounts Payable Voucher, only the total amount due was noted in the COST field as the cost of the transaction.
- 8. Upon review of the documentation, EPA and TechLaw identified 70 different main categories of waste. A list of waste types and corresponding subcategories of waste is presented in Table 1 on page 8.
- 9. PRP address information was provided to TechLaw by the EPA WAM. However, additional address research and verification was necessary for a number of PRPs. TechLaw conducted all follow-up address research and verification activities and entered the address information into the PRP address database.

The PRP names contained in the PRP address database are identical to the PRP names contained in the waste transaction database. A list of PRPs and corresponding address information is included in Appendix B.

10. The volumetric ranking summary was prepared by (1) converting all waste transaction units (i.e., tons, barrels, truckloads, etc.) into pounds, (2) adding all waste transactions which pertain to a particular PRP, and (3) multiplying each PRP's waste contribution by the total waste contribution to determine the percentage of waste contributed by each PRP. The volumetric ranking summary is included in Appendix C.

In instances when "unknown" was recorded in the UNIT field, a conversion of the unit could not be made. An asterisk (*) is recorded in the Total In Pound(s) column as a notation that the total volume reported does not include those records pertaining to a particular PRP which have an unknown unit of measure in any one of its waste transactions contained in the TDB.

The guideline TechLaw used for data extraction, entitled Database Field Definitions and Extraction Procedures is included in Appendix A.

4.0 DOCUMENT SECURITY

The USS Lead Refining, Inc. site waste transaction documents were obtained by TechLaw from EPA WAM. The documents were delivered to the TechLaw office by CannonBall Courier Service.

Through the duration of the project, the documents from the USS Lead Refining, Inc. site were maintained in a secure facility, with access to the documents being limited to authorized personnel. Each member of TechLaw works under a contract-wide confidentiality agreement, which prohibits the dispersal of project-specific information to unauthorized personnel outside of TechLaw.

APPENDIX A

DATABASE FIELD DEFINITIONS AND EXTRACTION PROCEDURES

APPENDIX A

DATABASE FIELD DEFINITIONS AND DATA EXTRACTION PROCEDURES (Extraction and Data Entry)

The following field definitions and procedures were used during the data extraction and data entry phases for compiling the waste transaction database (TDB) and volumetric ranking summary under the USS Lead Refining, Inc. (USS Lead) site work assignment. All guidelines were established in consultation with the Environmental Protection Agency work assignment manager (EPA WAM).

The TRANSNO field contains the transaction number of each record entered into the TDB. This transaction number is automatically assigned by the computer as records are input.

The GENERATOR field contains the name of the generator of waste brought to the USS Lead facility.

The TRANSPORT field contains the name of the transporter of waste brought to the USS Lead facility. The transporter of waste was identified on supporting documents which indicate waste transactions involving the "lead shipments." When the transporter was not provided, "Unknown" was recorded in the TRANSPORT field.

The DATE field contains the date of the shipment. Whenever possible, the shipment date was used to show the date of the transaction rather than the date the document was prepared. This date generally appeared in the "Date" column of the Accounts Payable Ledger or in the "Batteries Received" line of the Shipping Order/Bill of Lading.

If more than one transaction date was provided for the same transaction, the earliest date was used. The other dates were recorded in the COMMEN1 or COMMEN2 field to show the discrepancy. For example, if the date on the Shipping Order was 03/31/78 and the date on the Accounts Payable Ledger was 04/06/78. The earliest date (03/31/78) was recorded in the DATE field and "Date on the Accounts Payable Ledger is 04/06/78" was recorded in the COMMEN1 or COMMEN2 field.

If the transaction date was incomplete on one supporting document (i.e., no year was provided), the transaction date was made complete by a combination of all supporting documents. Generally, the year was listed on the Contract document and not on the Accounts Payable Ledger.

If the date was not provided on any of the supporting documents, the DATE field was recorded as 00/00/00.

The CONTRACT field contains the number of the contract.

The LOT field contains the number of the shipment lot.

The WEIGHT field contains the volume of the shipment. Typically, the weight was regarded as "wet weight."

The UNIT field contains the code for the unit of the shipment. A "t" was recorded to represent tons, a "p" was recorded to represent pounds, a "c" was recorded to represent containers, an "l" was recorded to represent truckloads, and an "o" was recorded to represent troy ounces.

The COST field contains the dollar amount for the transaction. The cost was typically written in the "Cost" column of the Accounts Payable Ledger. The cost provided on the Accounts Payable Ledger was compared and verified with the cost provided on the Accounts Payable Voucher, when available. Any discrepancy(ies) was noted in the COMMEN1 or COMMEN2 field. This figure did not represent the transaction cost after smelting operations which appeared in the "Total Cost" column of the Accounts Payable Ledger.

The **WASTE** field contains the code number which identifies the type of waste for each shipment.

The COMMEN1 or COMMEN2 field contains notes on discrepancies within the transaction. Discrepant weight, log numbers, costs, etc., were recorded in this field. Document assumptions were also noted in the COMMEN1 or COMMEN2 field.

The **DOCNO** field contains the unique number assigned to each supporting document.

The **DOCTYPE** field contains the code number which identifies the type of document used in support of each transaction. The code numbers and corresponding document types include the following:

- Accounts Payable Ledger
- 2. Contract
- 3. Accounts Payable Voucher
- 4. Credit Memorandum
- 5. Invoice
- 6. Shipping Order/Bill of Lading
- 7. Weight Ticket
- 8. Waste-In Ledger
- 9. Assay Report
- 10. Hazardous Waste Manifest
- 11. Scrap Lead Material Report
- 12. Receipt
- 13. Debit Memorandum
- 14. Handwritten Ledger
- 15. Report of Scrap Lead Return
- 16. Freight Bill

An example of each of the documents listed in the DOCTYPE field is included on the following pages.

Documents that did not pertain to a specific transaction or that could not be used to support a specific transaction were ignored. Typical documents which were not considered to provide waste transaction information include:

- o Average Metal Content Prices Ledger
- o Correspondence
- o Miscellaneous Handwritten Notes
- o Out-going Shipping Orders/Bills of Lading
- o Out-going Sales Transactions
- o Out-going Lead Shipments
- o Conversion Agreements
- o Work Orders

Whole Batteries (015-00-001)
